1. Customer workflow

Preparing a Halifax commercial renovation application

- Applicant matches project documents to municipal instructions for their project
- They decide which requirements apply, collect evidence, check consistency
- Missing or conflicting information can create avoidable follow-up and rework

Prototype scope — see status.md

2. Problem to test

Does preparation burden fall on repeat applicants?

- Hypothesis only — no interviews yet: repeat professional applicants feel this burden most
- Frequency, time cost, and willingness to pay are unknown
- We will validate all three through customer pilots — no claims made here

Prototype scope — see status.md

3. Our answer

PermitPath: source-backed readiness workspace (planned prototype)

- Document text → validated extraction → official rule pack → evidence check → report
- Every flag carries its evidence quote + page and cites the official source row
- Fix gaps, record review notes honestly, export a cited readiness report

Prototype scope — see status.md

4. Expected value + ask

Less preparation burden — if pilots confirm it

- Expected (unvalidated): fewer avoidable follow-ups; clearer missing-item list before filing
- No filing, no stamp, no municipal submission; AI extraction pending until final integration
- Ask: customer pilots to measure frequency, time cost, willingness to pay

Prototype scope — see status.md
